FA COST Action 870

From production to application of arbuscular mycorrhizal fungi in agricultural systems: a multidisciplinary approach

Descriptions are provided by the Actions directly via e-COST.

The main objective of the **Actions** is to take a multidisciplinary approach to increase the knowledge needed for implementation of arbuscular mycorrhizal fungi in agricultural systems, in order to reduce agricultural inputs and reduce losses to the environment.

In previous COST **Actions** (821, 838), considerable amounts of knowledge and insights on AM fungi have been developed. This COST **Action** focuses on the use of this obtained knowledge in practical systems.

The COST **Action** is novel in that it takes a multidisciplinary approach by bringing together diverse scientific areas ranging from applied mycorrhizal research, plant breeding and (low input) arable farming. The synergism that will occur by combining the scientific areas of plant breeding and mycorrhizal research is of particular importance. Plant breeding programmes have resulted in crops that have higher levels of resistance to pathogens, but they seem to show a reduced responsiveness and colonisation of AM fungi. More research on plant breeding is desirable to detect the plant genes involved in mycorrhization with the objective of developing crops with enhanced responsiveness and colonisation of AM fungi, leading to enhanced use of mycorrhizal resources in agriculture, and thereby increasing the sustainability of agriculture.

The secondary objectives of the COST **Action** are the following:

- To increase application of AM fungi in agricultural systems ranging from low- to high-input systems.
- To identify plant genes which control the responsiveness of crop plants to AM fungi. The aim will be to focus on crops that are of economic value in the participating countries.
- To facilitate the development of AM fungal inoculum with specificity for specific crops under different soil conditions and fertilisation regimes.
- To develop an independent quality control system for AM fungal inoculum.
